

Dataset Title: Olist E-commerce Dataset (Brazilian E-commerce Public Dataset by Olist)

Source of Dataset: <https://www.kaggle.com/datasets/olistbr/brazilian-ecommerce>

Brief Description of the Dataset

The Olist dataset contains information on 100,000 orders placed between 2016 and 2018 at the Olist Store in Brazil. It includes comprehensive data points such as order status, price, payment and freight performance, customer locations, product attributes, and reviews. This dataset is widely used for data mining and business intelligence tasks, as it enables multidimensional analysis of e-commerce behavior, ranging from logistics and supply chain tracking to customer segmentation and trend forecasting.

Challenges Encountered:

- Very time-consuming, especially when there are errors, and there are many worksheets to make. There are many adjustments needed to correct every error present.
- I had problems with the containers, and it was hard to make them into a grid. So I just adjusted and made a dashboard and story for that.
- Some of the charts have not been made due to their difficulty level, and the need of additional software is needed. I just skipped them so I would not have any problem.

Reflection and Key Learnings

I learned the different kinds of visualizations and their uses. I also learned to use visualizations based on theme or their use. It would be helpful in analysis as there would be a focus on what I want to find within the dataset.
